Some useful websites for research:

There are many online sources for reference materials. Some are free and some require a membership fee. Most of the free sites have limited availability of full-text books and articles. They usually provide abstracts which can give you a good idea about the source, along with places to order the text or to search further. In some cases, once you find an author or specific article, you can find the author's email address. You can then email the author directly to request the article. Many authors are gratified that students are interested in their work and will send copies or correspond via email about their research. You can also go to your school or community library and see if they subscribe to Internet data bases that you can use. Try your school administration and ask to look at copies of the research journals in their administrative or guidance offices.

**Google Scholar:** This free site is very useful for finding a large number of references on a specific topic. Many of the books and journals listed provide a certain number of pages, not the whole text. Some complete papers, especially older ones, are available. This may be enough for your work, or you may want to follow up and buy the book or order the full article using the information given. <http://scholar.google.com/>. It helps to narrow your search with the advanced scholar search page: [http://scholar.google.com/advanced\\_scholar\\_search](http://scholar.google.com/advanced_scholar_search).

**Wikipedia:** Because this encyclopedia is written and edited solely by its readers you cannot trust everything you find here. But it has links which can lead you to related authors, topics, and related material. This is often a good place to start. <http://www.wikipedia.org/>

**ERIC:** This is a good educational website offering both abstracts and full text. Google Scholar also searches ERIC. <http://www.eric.ed.gov/>

**Questia:** This is one of the best full-text sources for books and articles in education and related subjects. It is a membership site costing between \$10 and \$20 (US) per month depending on how many of the databases you want access to. It is well worth it while you are involved in masters classes and having to write research papers. <http://www.questia.com/Index.jsp>.

**Infomine:** Most of the resources here are fee-based but there are a lot of web-based journals that will allow you to read articles online. <http://infomine.ucr.edu/>

**Library of Congress:** This has many good resources for teaching as well as research. <http://www.loc.gov/index.html>.

**Research Guide for Students:** This Website is an extremely good resource for researchers. It provides guidelines for the technical aspects of writing a paper such as layout and style guides as well as links to other research resources on just about every topic imaginable. <http://www.aresearchguide.com/>
